# Test Verification of Conformity

On the basis of the referenced test report(s), sample(s) of the below product have been found to comply with the harmonized standards and Directives listed on this verification at the time the tests were carried out. Other standards and Directives may be relevant to the product.

Once all product relevant C Cmark directives are verified in compliance, the manufacturer may indicate compliance by signing a Declaration of Conformity themselves and applying the mark to product identical to the test sample(s) if the product complies with all relevant CE mark Directives requirements.

This Verification is for the exclusive use of Intertek's client and is provided pursuant to the agreement between Intertek and its Client. Intertek's responsibility and liability are limited to the terms and conditions of the agreement. Intertek assumes no liability to any party, other than to the Client in accordance with the agreement, for any loss, expense or damage occasioned by the use of this Verification. Only the Client is authorized to permit copying or distribution of this Verification. Any use of the Intertek name or one of its marks for the sale or advertisement of the tested material, product or service must first be opproved in writing by Intertek. The observations and test/inspection results referenced in this Verification are relevant only to the sample tested/inspected. This Verification by itself does not imply that the material, product, or service is or has ever been under an Intertek certification program.

#### TEST REPORT

Applicant Name & Address	:	GUANGDONG BE-TECH SECURITY SYSTEMS LIMITED. No. 17, Keyuan 3 Road, Ronggui, Shunde High-Tech Zone, Foshan,
Manufacturing Site	:	Same as above
Sample Description Product	:	Electronic Cabinet Lock
Model No. Electrical Rating	:	C1000D See page 4 for details
Date Received	:	27 October 2014
Date Test Conducted	:	30 October 2014-31 October 2014
Test standards	•	EN 61000-6-1: 2007 EN 61000-6-3: 2007+A1: 2011
Test Result	:	Pass
Conclusion	:	The submitted samples complied with the above EMC standards.
Remark *********************	: ***	None. *****************End of Page************************************

Prepared and Checked By:

Ivan Zhau Sr. Project Engineer Intertek Guangzhou

### **EMC Results Conclusion**

(with Justification)

RE: EMC Testing Pursuant to EMC Directive 2004/108/EC Performed On the Electronic Cabinet Lock, Model: C1000D.

We tested the Electronic Cabinet Lock, Model: C1000D to determine if it was in compliance with the relevant EN standards as marked on the Test Results Summary. We found that the unit met the requirement of EN 61000-6-3(Radiated emission (30 MHz–1000 MHz), EN 61000-6-1 (EN 61000-4-2), EN 61000-6-1 (EN 61000-4-3) standards when tested as received. The worst case's test data was presented in this test report. Test items Radiated emission (30 MHz–1000 MHz) & Radiated EM field immunity were subcontracted.

### **Rating:**

Working Voltage: DC 3.9~6.5V; External Voltage: DC 6~9V; Under Voltage Alarm Point: 4.1+/-0.2V; Static Current: Unlocking condition, =<30uA; Locking condition: =<50uA

The production units are required to conform to the initial sample as received when the units are placed on the market.

Standards against which no testing of the captioned model has been conducted and the engineering judgment is stated as follows:

2

3

Report No.: 141027077GZU-001 Issued: 2014-11-18

### LABORATORY MEASUREMENTS

### **Configuration Information**

<b>Equipment Under Test (EUT)</b> :	Electronic Cabinet Loch	Electronic Cabinet Lock		
Model:	C1000D			
Serial No.	Not Labeled			
Support Equipment:	N/A			
Rated Voltage:	DC 6V			
Condition of Environment:	Temperature : Relative Humidity: Atmosphere Pressure	22~28°C 35~60% 86~106kPa		

#### Notes:

1. The EMI measurements had been made in the operating mode producing the largest emission in the frequency band being investigated consistent with normal applications.

An attempt had be made to maximize the emission by varying the configuration of the EUT.

2. The EMS measurements had been made in the frequency bands being investigated, with the EUT in the most susceptible operating mode consistent with normal applications. The configuration of the test sample had been varied to achieve maximum susceptibility.

### 4 EMI TEST

### 4.4.2 Block Diagram of Test Setup

### 4.4.3 Test Setup and Procedure

The measurement was applied in a semi-anechoic chamber. The EUT and simulators were placed on a 0.8m high wooden turntable above the horizontal metal ground plane. The turn table rotated 360 degrees to determine the position of the maximum emission level. The EUT was set 3 meters away from the receiving antenna which was mounted on an antenna mask. The antenna moved up and down between from 1 meter to 4 meters to find out the maximum emission level.

Broadband antenna was used as receiving antenna. Both horizontal and vertical polarization of the antenna was set on measurement. In order to find the maximum emission, all of the interface cables were manipulated according to EN55022 requirement during radiated test. The bandwidth setting on R&S Test Receiver was 120 kHz.

The frequency range from 30MHz to 1000MHz was checked

Polarization of the antenna: Vertical

#### 4.4.5 Measurement uncertainty

The measurement uncertainty describes the overall uncertainty of the given measured value during the operation of the EUT. Measurement uncertainty is calculated in accordance with CISPR 16-4-2:2003. Measurement uncertainty of radiated emission: 4.27 dB. The measurement uncertainty is given with a confidence of 95%, k=2.

#### 4.5 Radiated Emission above 1 GHz

#### **Test Result: Not Applicable**

**Remark:** The highest internal source of the EUT is not more than 108 MHz, so the measurement above 1000 MHz is not applicable.

### 5 Harmonic of Current

### Test Result: Not Applicable

**Remark:** The products are powered by dry batteries only.

### 6 Flicker

#### **Test Result: Not Applicable**

**Remark:** The products are powered by dry batteries only.

### 7 EMS TEST

### Performance Criteria:

- Criterion The apparatus shall continue to operate as intended during the test. No A: degradation of performance or loss of function is allowed below a performance level (or permission loss of performance) specified by the manufacturer, when the apparatus is used as intended. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation and from what the user may reasonably expect from the apparatus if used as intended.
- Criterion The apparatus shall continue to operate as intended after the test. No B: degradation of performance or loss of function is allowed below a performance level (or permission loss of performance) specified by the manufacturer, when the apparatus is used as intended. During the test, degradation of performance is allowed, however, no change of actual operating state or stored data is allowed. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description, and documentation, and from what the user may reasonably expect from the apparatus if used as intended.
- Criterion C: Temporary loss of function is allowed, provided the function is self-recoverable or can be restored by the operation of the controls, or by any operation specified in the instruction for use.

#### **Measurement Uncertainty**

According to CISPR 16-4-2:2003, measurement uncertainty to immunity test is under consideration.

7.1 EN 61000-4-2(Pursuant to EN 61000-6-1) Electrostatic Discharge Immunity Tested Port: Enclosure Performance criterion: B Test Result: Pass

#### 7.1.1 Used Test Equipment

Equip. No.	Equipment	Model	Manufacturer
EM077-04	ESD Simulator	NSG437	TESEQ

### 7.1.2 Block Diagram of Test Setup

Note: HCP means <u>H</u>orizontal <u>C</u>oupling <u>P</u>lane, VCP means <u>V</u>ertical <u>C</u>oupling <u>P</u>lane GRP means Ground Reference Plane

#### 7.1.3 Test Setup and Procedure

The EUT was put on a 0.8m high wooden tabel/0.1m high for floor standing equipment standing on the ground reference plane(GRP) 3m by 2m in size, made by iron 1.0 mm thick.

A horizontal coupling plane(HCP) 1.6m by 0.8m in size was placed on the table, and the EUT with its cables were isolated from the HCP by an insulating support thick than 0.5mm. The VCP 0.5m by 0.5m in size & HCP were constructed from the same material type & thinkmess as that of the GRP, and connected to the GRP via a  $470k\Omega$  resistor at each end.

The distance between EUT and any of the other metallic surface excepted the GRP, HCP & VCP was greater than 1m.

The EUT was arranged and connected according to its functional requirements. The EUT was arranged and connected according to its functional requirements

Direct static electricity discharges was applied only to those points and surface which are accessible to personnel during normal usage.

Test voltage was increased from the minimum to the selected test level and with single discharge.

On each preselected points 10 times of each polarity single discharge were applied The time interval between successive single discharges is 1s.

The ESD generator was held perpendicular to the surface to which the discharge is applied. The discharge return cable of the generator was kept at a distance of 0.2m whilst the discharge is being applied. During the contact discharges, the tip of the discharge electrode was touch the EUT before the discharge switch is operated. During the air discharges, the round discharge tip of the discharge electrode was approached as fast as possible to touch the EUT.

Indirect discharge was conducted to objects placed near the EUT, simulated by applying the dischares of the ESD generator to a coupling plane, in the contact discharge mode.

After each discharge, the ESD generator was removed from the EUT, the generator is then retriggered for a new single discharge. For ungrounded product, a grounded carbon fibre brush with bleeder resistors  $(2 \times 470 \text{ k}\Omega)$  in the grounding cable was used after each discharge to remove remnant electrostatic voltage.

10 times of each polarity single discharge were applied to HCP and VCP. The detail selected points are listed in the following table.

### 7.1.4 Test Result

Direct Application of ESD			
Direct Contact Di	scharge		
Applied Voltage (kV) No. of Discharge for each point		Result	Discharged Points
2, 4	20	Pass	Accessible metal parts of the EUT Conductive substrate with coating which is not declared to be insulating

### Direct Air Discharge

Applied Voltage (kV)	No. of Discharge for each point	Result	Discharged Points
2, 4, 8	20	Pass	All accessible points where contact discharge cannot be applied such as Displays, Indicators light, Keyboard, Button, Switch, Knob, Air gap, Slots, Hole and so on

### **Indirect Application of ESD**

### Horizontal Coupling Plane under the EUT

Applied Voltage (kV)	No. of Discharge for each point	Result	Discharged Point
2, 4	20	Pass	At the front edge of each HCP opposite the centre point of each unit of the EUT

### Vertical Coupling Plane beside the EUT

Applied Voltage (kV)	No. of Discharge for each point	Result	Discharged Point
2, 4	20	Pass	The centre of the vertical edge of the coupling plane

### 7.6.2 Block Diagram of Test Setup

Filter

#### 7.6.3 Test Setup and Procedure

The test was conducted in an fully anechoic chamber to maintain a uniform field of sufficient dimensions with respect to the EUT, and also in order to comply with various national and international laws prohibiting interference to radio communications.

The equipment is placed in the test facility on a non-conducting table 0.8m high (for floor standing EUT, is placed on a non-conducting support 0.1m height).

The EUT was placed on the uniform calibrated plane which is 3V/m and 1V/mEM field. For all ports connected to EUT, manufacturer specified cable type and length was used, for those cables no specification, unshielded cable applied.

Wire is left exposed to the electromagnetic field for a distance of 1m from the EUT.

The EUT was arranged and connected according to its functional requirements

Before testing, the intensity of the established field strength have been checked by placing the field sensor at a calibration grid point, and with the field generating antenna and cables in the same positions as used for the calibration, the forward power needed to give the calibrated field strength was measured.

Spot checks was made at a number of calibration grid points over the frequency range 80 to 1000MHz and 1.4 to 2.7 GHz, both polarizations was checked.

After calibration, the EUT is initially placed with one face coincident with the calibration plane.

The frequency range is swept from 80 to 1000MHz and 1.4 to 2.7 GH, with the signal 80% amplitude modulated with a 1 kHz sinewave, pausing to adjust the r.f. signal level. The dwell time at each frequency was 3s so as that the EUT to be exercised and be able to respond.

The step size was 1% of the fundamental with linear interpolation between calibrated points. Test was performed with the generating antenna facing each of the four sides of the EUT.

### 7.6.4 Test Result

Frequency (MHz)	Exposed Side	Field Strength (V/m)	Result
80 to 1000	Front	3V/m (r.m.s.)	Pass
80 to 1000	Left	3V/m (r.m.s.)	Pass
80 to 1000	Rear	3V/m (r.m.s.)	Pass
80 to 1000	Right	3V/m (r.m.s.)	Pass

Frequency (GHz)	Exposed Side	Field Strength (V/m)	Result
1.4 to 2.0	Front	3V/m (r.m.s.)	Pass
1.4 to 2.0	Left	3V/m (r.m.s.)	Pass
1.4 to 2.0	Rear	3V/m (r.m.s.)	Pass
1.4 to 2.0	Right	3V/m (r.m.s.)	Pass

Frequency (GHz)	Exposed Side	Field Strength (V/m)	Result
2.0 to 2.7	Front	1V/m (r.m.s.)	Pass
2.0 to 2.7	Left	1V/m (r.m.s.)	Pass
2.0 to 2.7	Rear	1V/m (r.m.s.)	Pass
2.0 to 2.7	Right	1V/m (r.m.s.)	Pass
